Project Description: (here you write what you did in this project (contribution) including Model Description

Dynamic Online Job Portal and Recruitment Management System is a full-stack web-based recruitment platform designed to connect **job seekers, employers, and administrators** through a centralized and secure system. The platform simplifies the complete recruitment process, from user registration and job posting to job searching, online applications, candidate management, and administrative monitoring.

The system provides **role-based access** for three types of users: Job Seekers, Employers, and Administrators. Job seekers can create and manage their profiles, upload resumes, search and filter available jobs, save interesting jobs, apply online, and track their application status. Employers can create company profiles, post and manage job vacancies, view applications, reviewed candidates, and update application statuses such as *Under Review*, *Shortlisted*, *Selected*, or *Rejected*.

As part of **Module 1: Front-end & Job Search**, I contributed to the development of the user-facing job portal interface, including the **job listing UI, search functionality, filtering interface, responsive layouts, and job details pages**. I implemented interfaces that allow users to search jobs using keywords and locations and filter them based on job type and other available criteria. I also tested the forms, navigation, job listings, search/filter functionality, and responsive behavior across different screen sizes.
